

SOUTH AFRICAN SUGAR INDUSTRY AGRONOMISTS ASSOCIATION

CODE: Ripening 79/03/Sw/Sim 'R'

CAT: 2193

CHEMICAL RIPENING OF VARIETIES WITH GALLANT SUPER AND FUSILADE SUPER**1. PARTICULARS OF PROJECT**

This crop	: 1 st Ratoon	Age	: 11.9 months			
Site	: Simunye Sugar Estate	Dates	: 9/5/2002 – 7/5/2003			
Field	: 604 Panel 2	Irrigation	: Fully irrigated (surface drip)			
Region	: Northern Irrigated (Swd)	Ripener application details:				
Soil Set	: 'R'	Variety	Date	Age(m)	Weeks	Purity%
Design	: Random. blocks, 4 reps	NCo376	27/2/03	9.7	9.8	67.0
Variety	: N23, N25, NCo376	N23	27/2/03	9.7	9.8	71.0
Plot size	: 5rows x 10.5m x 1.5m (gross) 3rows x 8.5m x 1.5m (net)	N25	27/2/03	9.7	9.8	70.0

2. OBJECTIVE

- To compare the response of varieties NCo376, N23 and N25 to treatment with Fusilade Super and Gallant Super.
- To validate the spray to harvest intervals recommended for Fusilade Super and Gallant Super.

3. TREATMENTS

- Control
- Fusilade @ 0.30 l/ha at 10 weeks
- Fusilade @ 0.45 l/ha at 10 weeks
- Gallant @ 0.15 l/ha at 10 weeks
- Gallant @ 0.225 l/ha at 10 weeks

Fusilade and gallant were applied with a CO₂ constant pressure knapsack sprayer and a hand held 'T' boom fitted with two TK 1.5 flood nozzles, delivering ± 52 l/ha over a swath width of 6m at 200kPa.

4. SAMPLING PROCEDURE

Groups of 4 stalks were taken from the net plot rows in a systematic manner on each sampling occasion to give a total of 16 stalks per plot. On subsequent occasions, sampling started one pace further into the plot and the same sequence of sampling was followed.

5. RESULTS AND DISCUSSION

Sample data

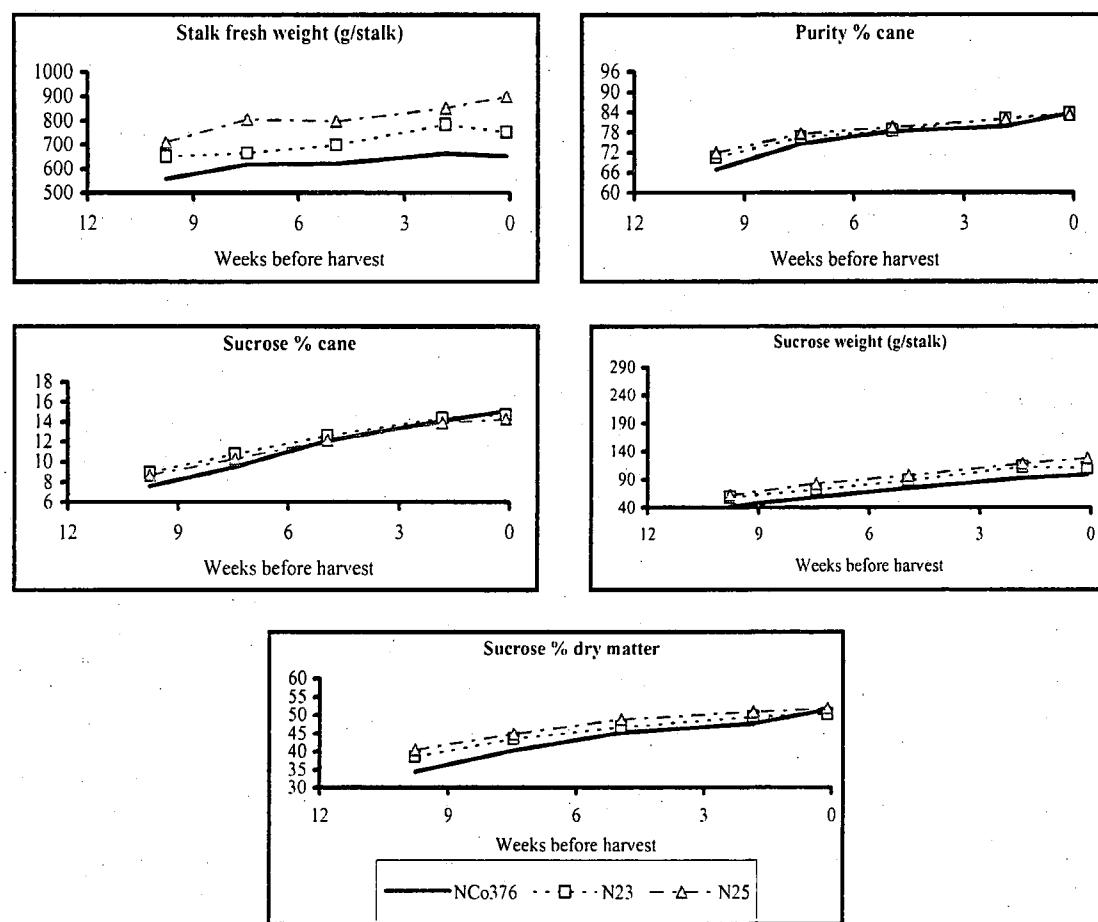

Juice purity averaged 67%, 71% and 70% for NCo376, N23 and N25 respectively when Fusilade and Gallant were applied in February. This suggests that the cane was too immature and should have, therefore, responded significantly to the ripeners.

Both ripeners, at all rates, increased juice purity, sucrose and erc % cane at harvest. Both rates of Fusilade outperformed the lower rate of Gallant Super but there was no significant difference when Fusilade was compared with the higher rate of Gallant Super. NCo376 yielded significantly more sucrose and erc % cane than N23 and N25, which yielded statistically similar.

Ripeners did not increase sucrose and erc weight at all sampling periods. N25 yielded significantly more sucrose and erc than NCo376 and N23 while N23 was intermediate and significantly better than NCo376.

Ripeners increased significantly the sucrose % dry matter of varieties at harvest. Both rates of Fusilade Super yielded statistically similar to the higher rate of Gallant Super. There was no significant difference between the lower rate of Gallant Super and the higher rate of Fusilade.

Figure 1: Sample data (see notes)

Harvest Results

Treatments had no significant effect on cane yield (Table 1). Improvements in sucrose and erc % cane were significant for all treatments, with the lower rate of Gallant Super performing poorly when compared with Fusilade and the higher rate of Gallant Super.

Ripeners did not significantly increase yields of sucrose and erc.

NB: sucrose measured as per

6. CONCLUSIONS

- The results show that the quality of sufficiently immature cane can be improved significantly by all rates of either Fusilade Super or Gallant Super, with no effect on cane yield.
- There were no statistical differences among yields of sucrose or erc.

BMS/DB

17/5/2004
