

SOUTH AFRICAN SUGAR INDUSTRY
AGRONOMISTS' ASSOCIATION

Code: HW157/77/R3

Cat No: 1275

Title: Herbicide phytotoxicity to varieties

1. Particulars of the project

<u>This crop</u>	:	3rd Ratoon
<u>Site</u>	:	Pongola Field Station
<u>Region</u>	:	Northern area
<u>Soil system</u>	:	Komatipoort
<u>Soil form/series</u>	:	Hutton/Shorrocks
<u>Design</u>	:	Randomised blocks + splot plots
<u>Variety</u>	:	6 Varieties
<u>Fertilizer/</u> kg/ha	:	N P K 138 23 100
<u>Date sprayed</u>	:	23.12.80
<u>Sprayer</u>	:	CP ₃ knapsack
<u>Nozzle</u>	:	TK5
<u>Pressure</u>	:	2 bars
<u>Time</u>	:	0600-0900
<u>Weather</u>	:	Clear and warm
<u>Soil</u>	:	Moist

Soil analysis: Date 4.6.81

pH	O.M.%	Clay%	Silt%	Sand%	CEC
6,7	1,75	23	11	66	10-90
ppm.					

P K Ca Mg Zn Al
22 176 784 >220 - -

Age: 11,8 months Dates: 11.11.80-4-11-81

Rainfall: 597 mm

Irrigation: 610 mm

Total: 1207 mm

Wind: Very slight

Temperatures (8 am): 28,3°C
(2 pm): 35,8°C

Rel. Humidity: (8 am): 80%
(2 pm): 41%

2. Objectives:

To determine the sensitivity of six varieties to a range of herbicide treatments.

3. Treatments:

<u>Chemical</u>	<u>Rate in kg or ℥ ai or ae/ha</u>	<u>Rate in kg or ℥ prod/ha</u>
1. Control (unsprayed)	-	-
2. Diuron + paraquat	3,2 + 0,5	4 + 5
3. Diuron + MSMA	4,8 + 4,32	6 + 6
4. Diuron + 2,4-D amine + S	4,0 + 2,88	5 + 4

NB. Rates used were twice those normally recommended.

4. Cane growth stages at the time of application were:

	NCo 376	NCo 293	N52/219	N55/805	N8	N11
Leaf canopy height (mm)	600	650	550	750	400	450
Av.No. leaves unfurled/shoot	6-8	6-8	6-7	6-7	5-7	5-7

5. Experimental

The nozzle was held directly over the cane rows and the output was 310 l/ha.

6. Results:

6.1 Visual ratings of leaf scorch (L.S.) and stunting (St) taken 20 days after spraying. Leaf scorch ratings are based on a 1-9 scale where 1 = no effect and 9 = dead, while stunting ratings are based on a 1-5 scale where 1 = very poor and 5 = no stunting.

Variety treatment	Control		Di + pa		Di+MSMA		Di+2,4-D	
	L.S.	St.	L.S.	St.	L.S.	St.	L.S.	St.
NCo 376	1	5	4,3	2,8	3,5	3,8	4,3	1,5
N52/219	1	5	3,3	3	4	3,8	4,3	2,3
N55/805	1	5	5,3	2,5	4	4	2	4
NCo 293	1	5	5	2	4	3,5	3	2,5
N8	1	5	5,5	1,5	5	2,5	6	1
N11	1	5	4,3	2,3	3,3	3,8	2,5	2,8

6.2 Stalk populations and height measurements taken 8 days and one, three and five months after spraying

Diuron + 2,4-D + S	0,5	1	0	0	25,3	22,5	0	0	0	0	13,8	27,8

6.5 Lodging - Number of lines lodged per plot at 11 months

Treatment	NCo 376	N52/219	N55/805	NCo 293	N8	N11
Control	1,3	1	1,3	1,3	3,3	3
Di + par	0	1,8	1,5	0,5	2,3	0,5
Di + MSMA	1,3	1,8	1,3	2	1,3	1
Di + 2,4-D + S	1,3	1,8	0,8	0,8	3	0,5

7. Comments:

Visual ratings:

Generally very severe leaf scorch symptoms were evident on all varieties even from diuron + 2,4-D amine + S. The hot conditions were probably responsible for an exaggerated effect.

Stunting was also marked due to most treatments. Least stunting occurred in N55/805 after treatment with diuron + 2,4-D + S and diuron + MSMA while the greatest effect appeared to be on N8 after treatment with diuron + 2,4-D + S.

Early stalk measurements:

All varieties were affected by all treatments in terms of stalk length but differences occurred between treatments and varieties in the degree of severity. N8 was the most severely affected variety and N55/805 the least, the latter showing particular insensitivity to diuron + 2,4-D + S and diuron + MSMA. Diuron + MSMA was generally safer than the other two treatments. Varieties NCo 376, N52/219 and N8 were more sensitive to 2,4-D than paraquat while the reverse was true for varieties N55/805 and N11. Very little difference occurred between these treatments on NCo 293.

Populations of stalks were slightly reduced by herbicide treatments initially except in NCo 293. However, compensatory tillering occurred subsequently causing treated cane to have higher populations. Ultimate differences were small except for N8 after treatment with diuron + 2,4-D and N52/219 after treatment with diuron + MSMA.

Yield

Cane (t/ha)

Generally trends followed stalk height differences and statistically significant reductions were produced. Average percent reductions from the treatments on all varieties were:

Di + MSMA	-	5%
Di + par	-	10%
Di + 2,4-D	-	12%

Ers % cane

This was affected in N8 and N11 only. Diuron + paraquat affected ers% of N11 and all treatments appeared to affect that of N8.

Flowering:

No flowering occurred in this experiment.

Diseases:

Smut occurred in varieties NCo 376, N55/805 and N11. An increase in smut whips was apparent in N55/805 after treatment with diuron + 2,4-D + S.

Lodging:

Severe lodging occurred in this experiment. Slight differences were apparent between treatments but these results cannot be regarded as 100% reliable.

General comments:

The most sensitive variety was N8 and the most phytotoxic treatment was diuron + 2,4-D + S.

Some specific differences appear to be:

N11 and N55/805 are sensitive to diuron + paraquat but much less so to diuron + 2,4-D and diuron + MSMA.

N52/219 is not as sensitive as other varieties to paraquat. Diuron + 2,4-D is particularly phytotoxic to NCo 376, N52/219, NCo 293 and N8.
